

User Manual

Data Management Portal -- guide to every module

Generated on: 21/07/2026

Audience: database administrators and data teams

1. What the portal is

The Data Management Portal brings together, in one place, the records a data team usually scatters across spreadsheets: who has access to what, what changed in the structures, how backup is configured, whether restore was tested, the meaning of each column, the integrations between systems and the scheduled routines.

It does not connect to the managed databases nor run anything on them. It is a record of what the team agreed and of what happened -- which is why it works well for audits and for handing knowledge between people.

The screen

The sidebar lists the modules and, at the bottom, shows the user panel with photo, name and the shortcuts to change password and sign out. At the top sit the icon and title of the open module, the search box, the light/dark theme button, the language and the shortcut to your own profile. The Add button always sits above the list.

Portuguese and English coexist: the PT/EN button switches the whole interface, including the manuals, which have a version in both languages.

2. First sign-in

Sign in with the username and password you received. If the administrator flagged a mandatory change, the portal asks for a new password before releasing any screen -- and that requirement is checked on the server, so there is no way around it through the interface.

The password needs at least 8 characters, with a letter and a digit. When you change it, every session open on other devices is dropped: that is the expected behaviour when you suspect unauthorized access.

Two-step verification

In My Profile you can turn on two-step verification. From then on, signing in sends a six-digit code to your e-mail; it lasts 10 minutes and allows five attempts. Resending has a one-minute interval and a limit of five times per login.

Verification can only be turned on after the administrator configures and tests e-mail sending in Settings. Without that, the code would have no way to reach you.

Your photo

In My Profile, the Change photo button opens the file picker. The image is cropped at the centre and reduced to 256x256 by the browser before uploading, so a large portrait becomes a few kilobytes. It shows up in the sidebar, at the top and in the user list. Removing brings back your name initial.

3. How the lists work

Every module behaves the same way, which means learning one is learning them all.

Feature	What it is for
Search	Scans the text columns of the open module.
Filters	Narrows by a list column, such as status or criticality.
Columns	Hides what does not matter now. The choice applies only to you.
Selection	Tick several rows to delete at once.
Export	Downloads what is on screen as CSV or PDF, respecting filters.
Send by e-mail	Sends the same content as an attachment, if SMTP is configured.

Clicking Add or a row opens the record window in the centre of the screen. List fields -- type, environment, criticality, status -- come from the Cadastro module, not from a fixed list in the code.

4. The modules

Overview

The home screen sums up the portal in figures: records per module, disabled jobs, pending restore tests and access entries needing review. The tiles lead to the matching module.

Field	What to record
Disabled jobs	Counts routines with status Disabled. The portal does not monitor execution, so it shows what was turned off, not what failed.
Other tiles	Total records of each module allowed for your account.

Access

Inventory of who has access to what. It is the module most asked for in audits, because it answers the question "who can read this table and since when".

Field	What to record
User and server	Who received the access and where.
Object and level	What was granted and at which level (read, write).
Justification	Why the access exists. This is the field that saves the audit.
Requester and approver	Who asked and who authorized.
Review	Date of the next review of the access.

Changes

Record of what changed in the structures: a new column, an index, a corrective load.

Field	What to record
Code and date	Change identification and when it happened.
Objects	List of affected objects, with the type of each.
Script and rollback	What was run and how to undo it.
Outcome	How it ended, including when it went wrong.

Filling in the rollback at the time of the change, not afterwards, is what makes the record useful at three in the morning.

Backup

The screen holds two lists: the backup policy per database and the restore tests. Each has its own Add button, at the right of the section.

Field	What to record
Policy	Type, window, retention and destination of the backup of each database.
Restore	Tests performed, with elapsed time and outcome.

A backup without a restore test is an assumption. The module separates the two on purpose.

Jobs

Scheduled routines: loads, purges, reindexing. It replaces the habit of keeping this in the head of whoever created it.

Field	What to record
Command / Step	List of steps: the step name and what it runs. Use + to add as many as needed.
Frequency	Daily, weekly, monthly.
Frequency interval	How often the routine repeats.
Schedules	Execution windows, each with a start and an end. Also accepts several.
Owner	Who takes care of the routine when it stops.
Status	Active or Disabled -- the latter feeds the Overview tile.

Steps and schedules appear as a column in the list and come out organized in the CSV and PDF exports.

Dictionary

The business meaning of each table and column of the databases you manage -- different from the technical dictionary of the portal itself, which is in the diagram PDF.

Field	What to record
Server, database, table	Where the item lives.
Column and type	The field and the data format.
Description	What it means for the business, in plain language.

Integrations

Flows between systems: where the data comes from, where it goes, how often and who answers for it.

Field	What to record
Source and target	Systems, servers and IPs at both ends.
Window	When the integration runs.
Owner	Team or person called when the flow stops.

Cadastro

The lists that feed the selection fields of the other modules. The screen shows one card per list, grouped by the module it belongs to; clicking Manage opens the options of that list.

Field	What to record
Add option	The option starts appearing in the matching form.
Rename	Changes the displayed text, without affecting existing records.

Several lists repeat their name across modules -- Type, Status, Criticality. That is why the card also shows the module, so there is no doubt about which one you are editing.

5. Administration

Users and permissions

Each account has a role and a list of allowed modules. The role says what the person can do; the list says where. A escrita account with access only to Jobs maintains and changes jobs, and does not see the other modules.

Role	Scope
leitura	Read only.
escrita	Reads and maintains records.
admin	Plus users, lists and configuration.
master	Plus the audit trail and actions on another master.

When editing an account, the Photo field at the top of the window lets you change or remove that person photo. It does not appear on creation: the photo is stored by the user identifier, which only exists after saving.

Disabling an account is better than deleting it: the history and the audit trail stay intact, and the person stops being able to sign in immediately.

Settings

Holds the portal identity (name and logo), the session inactivity timeout and the e-mail server. Sending must pass the test before being used by two-step verification and by report delivery.

If the SMTP server has no encryption, the portal warns you: username and password would travel in clear text.

Security and audit

The security screen shows recent blocks and login attempts. The audit trail, restricted to master, keeps who changed what, when and from which IP -- including deletions.

Wrong logins are limited to five per user and IP, and twenty per IP. The second cap exists to contain attempts that sweep many users from the same place.

Behind a reverse proxy, `trusted_proxies` in `conf/config.php` must be filled with the proxy IPs. Without that, everyone arrives with the same address and the per-IP cap may block the whole organization.

6. Documentation

The Documentation module delivers three PDFs, each in Portuguese and English: this user manual, the API manual and the diagram with the dictionary of the portal internal database. They are generated from the code, so they follow the changes of the tool.
